

Polish soft – medium – strong

Liquid cleaning and polishing agent for gelcoat and painted surfaces. After polishing, the surfaces are given a lasting deep shine, care and protection against UV radiation and dirt!

Depending on the condition of the surface, there are three different processing methods:

Polish soft:

Cleaning agent, removes light soiling.

Polish medium:

Medium polish for heavier soiling and scratches.

Polish strong:

Removes heavy oxidation, fading and scratches. Suitable for matt surfaces. Use with caution: Polish strong is a strong and viscous polish with an abrasive effect.

Instructions for use:

- Ensure that the surface to be treated is clean and free of sand, salt and other contaminants. To do this, clean the surface with a sponge and clear water.
- In the case of heavy soiling such as soot or oil, clean the surface to be treated with Polish Soft.
- To achieve optimum polishing results, we recommend using a machine.
- Apply the polish with a sanding pad (medium, do not use a lambskin) at approx. 600 revolutions.
- Then polish the surface to a high gloss with the polishing machine at approx. 900 revolutions.
- Finally, seal the surface with Polish & Protect Polymer Sealant (see Polish & Protect Polymer Sealant instructions for use).

Please observe health and safety measures during all work processes: Dust mask and safety goggles!
